PROFILE SUMMARY

Backend Engineer with ~4 years of experience building and modernizing financial systems across trading, risk management, and AML transaction monitoring platforms. Experienced in developing distributed backend services, event-driven systems, and ETL for high-throughput financial workflows. Proven track record of delivering end-to-end backend features from system design to production deployment while upgrading legacy enterprise platforms. Actively exploring and building Agentic AI using diverse python frameworks.

SKILLS

Programming Languages	: Java, Python, SQL (PostgreSQL, Oracle), Shell
Backend & Frameworks	: Spring Boot, Spring Batch, Hibernate, Kafka, JMS, ActiveMQ, TIBCO EMS, JBoss, Tomcat, React
AgenticAI	: LangChain, MCP, Prompt Engineering, RAG
Cloud & DevOps	: AWS, Docker, Jenkins, Git, GitHub, GitLab
Software Engineering skills	: API Design & Development, Distributed Systems, Event-Driven Architecture, Microservices, System Design, Data Structures & Algorithms, SDLC, AI-Assisted Development Tools

WORK EXPERIENCE

WESTERN UNION | Junior Associate (Java Developer)

Pune, India | Mar 2025 – Present

- Led the modernization of an Anti-Money Laundering (AML) transaction monitoring platform processing millions of financial transactions by replacing a legacy JBoss EAP–deployed system to a standalone Spring Boot service with embedded Tomcat, improving batch transaction throughput by 40–50%.
- Replaced JBoss-managed web components with Spring Boot REST APIs and migrated JNDI DataSources to HikariCP connection pools, enabling lightweight, self-contained services and removing application server dependencies.
- Designed and developed the messaging layer by migrating from ActiveMQ Artemis to embedded ActiveMQ Classic using Spring JMS, and integrated Kafka producers to stream processed transaction events from internal JMS queues to downstream fraud investigation and case-management systems.
- Migrated a TIBCO EMS Message-Driven Bean (MDB) consumer to a Spring Boot JMS service, improving message processing performance and reducing memory usage by eliminating EJB container overhead.
- Transitioned a financial transaction processing pipeline built using Spring Batch from JBoss-hosted deployment to standalone execution, preserving partitioned batch jobs, DB2 transactional staging, and Drools-based rule processing while simplifying deployments.
- Upgraded all three platform components (AML API service, TIBCO JMS consumer, and batch) from Java 8 to Java 17, resolving cross-module dependency conflicts and modernizing the runtime stack.
- Implemented a multi-module Maven architecture separating API, batch processing, and messaging services with a shared common library, enabling independent builds, deployments, modular code reuse, and full local execution for faster debugging and development.
- Eliminated proprietary JBoss licensing across 26 PROD application server instances, delivering significant infrastructure cost savings.
- Improved development productivity by ~50% leveraging AI-assisted tools for debugging, code generation, and unit test scaffolding tools.

CLSA | Software Engineer (Fullstack)

Pune, India | July 2022 – Feb 2025

- Developed custom Java solutions and configurations for a trading and risk management platform, implementing business workflows, financial reporting features, and integrations for processing live trading data and supporting risk analysis.
- Resolved data discrepancies and migration challenges during the platform version upgrade, ensuring accurate financial data transition and minimizing operational risk.
- Contributed to a Spring Boot–based Initial Margin application, implementing report-generation logic and leveraging Hibernate for efficient PostgreSQL data retrieval.
- Developed a React-based UI for the Initial Margin application, enabling users to manage system configuration data and view aggregated processing summaries via Spring Boot REST APIs.
- Designed and implemented a Python-based ETL utility to extract equity trading data from database, transform and merge it with trading reports, and automate report generation workflow, reducing DOI report generation time from 8–10 hours to ~1 hour.

- Developed a Spring Boot–based integration utility JAR encapsulating trading platform APIs, enabling multiple applications to access platform data through a shared interface while eliminating the need for individual platform JAR dependencies in each project.
- Used AI-assisted tools to improve development productivity.

EDUCATION

SAVITRIBAI PHULE PUNE UNIVERSITY | Bachelor of Engineering - Computer Science

Pune, India | Aug 2018 - May 2022

- CGPA : 9.17/10

CERTIFICATION & ACHIEVEMENTS

- Certification (from Anthropic): [Anthropic Claude with amazon bedrock](#).
- Received the All-Star Award for leading the JBoss to Spring Boot modernization of the AML transaction monitoring platform.
- Received the All-Star Award for contributing to the removal of JBoss dependencies from batch and TIBCO consumer services, eliminating enterprise licensing costs.

PROJECTS

Data Analysis Chatbot

Technologies: Python, FastAPI, LangChain Agent, Prompt Engineering, Plotly, Pandas, React, Redis

- Built a fully functional data analysis AI Agent with a data pipeline that helps users with data analysis by querying in natural language. The Agent generates complex SQL queries, converting data to csv and generates graphs.
